## **Overview of VoxStor**

*By Bill Houser  
Director of Sales*

VoxStor can playback the video and synchronize multiple channels of audio to the incidents, allowing various video cameras to sweep a 360 degree radius of the area and playback the audio and the video to re-create the scenario. Not only can you listen to the event but you have a visual picture of the incident and place personnel with times and dates. Synchronizing of audio and video can become very valuable in a military scenario, a crime scene or any kind of reenactment.

We appreciate the future of communications is through the internet and through IP type connections. Today's society is now a mobile one, where everyone has a telephone or a way to be contacted. IP Communication is a no cost solution because the internet is utilized and more people are telecommuting.

This solution is the only way Government and other organizations can maintain an accounting of what was said, who said it and what time it was said. Now we can provide video with the playback of the incident.

Government Contractors and Military Integrators recognize the need for interoperability of IP conversations for the Military personnel on the run or in battle.

- Mobile Battlefield Command Centers and Mobile Communication Shelters are dropped into a hot zone, having an immediate need to record situations.
- Emergency Personnel can have instant communications and recording in an area where all communications have been destroyed by a natural disaster.
- Military Training Centers for rotated or deployed Military personnel can re-enact a skirmish or battlefield scenario with the VoxStor Recorder for training purposes.
- Flight Simulators or any actual Missions will have an audio and a video recording of the sortie for an after the fact evaluation or review to discuss changes that may need to be made. The events of the mission will be recorded and then sent to a network area server (NAS) or to a raid for long term storage.
- Surveillance Cameras in secure areas will be synched with the audio microphones for playback to re-create the audio incident as well as the visual.
